

These days, more and more papers and documents are being digitised so that they can be accessed on a smartphone.

From transport tickets to event tickets, you can even use your bank card from your phone.

However, identity papers will not be available in digital form in 2020.

Today, we all have our smartphone at our fingertips:

Our aim is to make it easier to access our identity card from a smartphone, while guaranteeing security and confidentiality.

That's where the idea for Qrypt'ID came from:

An application that enables anyone who wants to to have their identity card on their smartphone.

In the long term, it aims to completely replace current identity documents.

The application is highly secure and is based on double encryption on both the cardholder's phone and the phone that wishes to check it.

We use an algorithm that is now widely used in the exchange of confidential data: RSA encryption.

Data is exchanged via QR code from our application.

Qrypt'ID protects you while making your life easier.
